2

## Encapsulation

- Information is encapsulated inside of headers
- Kind of like how a sub-class extends features of another class by adding something to the class
- Product is a 'Frame'

4 August 2008

4

## Today's Lecture: Ethernet Part 2

- Ethernet Link Layer
  - Information to transmit
  - Addresses
  - Protocol types
  - Error checking code
  - Synchronisation
- Frames

4 August 2008

5

## Ethernet Addressing

Ethernet systems use a shared medium to communicate. We require the ability to distinguish between nodes when sending messages. We do so using addresses.

© THE UNIVERSITY OF WAIKATO • TE WHARE WAIKATO O WAIKATO

4 August 2008

6

## Ethernet Addresses

### • Ethernet addresses

- known as Ethernet MAC addresses (Medium Access Control)
- are 48-bits in size. (6 bytes)
- are unique (barring errors)
- are assigned by the NIC manufacturer
- are usually written as six pairs of hexadecimal characters, each pair separated by a colon

© THE UNIVERSITY OF WINNATO • TE WAIWAI WAIWAI WAIWATO

4 August 2008

7

## Ethernet Addresses

• 00:05:1C:11:BE:FF

- 6 pairs of hexadecimal digits
- each pair separated by a colon
- Hexadecimal digits (base 16) are thought to be more convenient to use than base 10 in this scenario

© THE UNIVERSITY OF WINNATO • TE WAIWAI WAIWAI WAIWATO

4 August 2008

8

## Hexadecimal numbers

### • Base 10

- $1234_{10}$
- 4 + 3 lots of ten + 2 lots of one hundred + one thousand
- $4 + 3 \text{ lots of ten} + 2 \text{ lots of ten squared} + \text{one lot of ten cubed}$
- $(4 \times 10^0) + (3 \times 10^1) + (2 \times 10^2) + (1 \times 10^3)$

© THE UNIVERSITY OF WINNATO • TE WAIWAI WAIWAI WAIWATO

4 August 2008

9

## Hexadecimal numbers

### • Base 16: need 16 digits instead of 10

- 10      A
- 11      B
- 12      C
- 13      D
- 14      E
- 15      F

### • Base 16

- $4D2_{16}$
- 2 + 13 lots of 16 + 4 lots of 16 squared
- $(2 \times 16^0) + (13 \times 16^1) + (4 \times 16^2)$

© THE UNIVERSITY OF WINNATO • TE WAIWAI WAIWAI WAIWATO

4 August 2008

10

## Kinds of communication

- One to one (normal case)
  - Only the addressee uses the message
- Broadcast
  - Sender addresses all machines on the network
- Multicast
  - Sender addresses all machines who want to listen
- Promiscuous
  - Receiver looks at every passing message

© THE UNIVERSITY OF WINNATO • TE WAIWAI WAIWAI WAIWATO

4 August 2008

11

## Ethernet addressing

- Broadcast messages
  - FF:FF:FF:FF:FF:FF
- Multicast addresses
  - Reserved
  - [1bbb]:xx:xx:xx:xx

© THE UNIVERSITY OF WINNATO • TE WAIWAI WAIWAI WAIWATO

4 August 2008

12

## Network interfaces

- Can receive, by default
  - All messages for its own address
  - All messages broadcast
- Can be programmed to receive multicast messages
- Can be programmed to receive all messages (promiscuous)

4 August 2008

13

## Ethernet addresses

```
cms-r1-17:[101]~>/sbin/ifconfig
eth0      Link encap:Ethernet  HWaddr
          00:19:B9:19:2A:9E
          inet addr:130.217.252.17
```

© THE UNIVERSITY OF WARWICK • TE WARE WAWANGA O WAWATO

4 August 2008

14

## Ethernet hubs

- Ethernet hubs forward messages out all ports

© THE UNIVERSITY OF WARWICK • TE WARE WAWANGA O WAWATO

4 August 2008

15

## Ethernet switches

- Ethernet switches usually only forward messages out the appropriate port
  - Interfaces in promiscuous mode won't see messages that the switch does not forward

© THE UNIVERSITY OF WARWICK • TE WARE WAWANGA O WAWATO

4 August 2008

16

## Ethernet switches

- Ethernet switches will forward broadcast messages out all ports
  - Interfaces in promiscuous mode won't see messages that the switch does not forward

© THE UNIVERSITY OF WARWICK • TE WARE WAWANGA O WAWATO

4 August 2008

17

## Ethernet Frames

© THE UNIVERSITY OF WARWICK • TE WARE WAWANGA O WAWATO

4 August 2008

18

## Ethernet Frames

- Destination MAC Address: destination!
- Source MAC Address: source!
- EtherType: protocol type
  - Allows multiple types of Network protocols to be carried in Ethernet frames
  - IPv4 0x0800
  - IPv6 0x86DD
- CRC32: error checking field
  - Fairly strong technique to detect (but not correct) errors in received message

© THE UNIVERSITY OF WAIKATO • TE WHARE WAIKATO O WAIKATO

4 August 2008

19

## Ethernet Frames on the wire

- Ethernet also specifies how the frame should be transmitted on the physical medium
  - 8 byte preamble before transmission of frame:
    - 7 bytes of 10101010
    - 1 byte of 10101011
  - Used to allow receiver to synchronise its clock
  - 12 byte (96 bit) delay after transmitting frame before node can send again
  - Information must be at least 46 bytes
    - $46 + 14 + 4 = 64$  bytes
  - Required to allow receiver to detect collision

© THE UNIVERSITY OF WAIKATO • TE WHARE WAIKATO O WAIKATO

4 August 2008

20

## So far

- Specified physical characteristics of Ethernet
- Specified Ethernet link layer
- We've now encountered multiple types of addresses
  - DNS names sorcerer.cs.waikato.ac.nz
  - IPv4 addresses 130.217.250.39
  - Ethernet MAC addresses 00:05:1C:11:BE:FF
- Why are there multiple addressing schemes?

© THE UNIVERSITY OF WAIKATO • TE WHARE WAIKATO O WAIKATO

4 August 2008

21

## So far

- Ethernet
  - 48 bit MAC address
  - Flat addressing scheme
  - Connect machines in small network
- Internet Protocol v4 (IPv4)
  - 32 bit IP addresses
  - Structured addressing scheme
  - Internet-wide addressing

© THE UNIVERSITY OF WAIKATO • TE WHARE WAIKATO O WAIKATO

4 August 2008

22

## Networks

MAC addresses are wired in (flat)

© THE UNIVERSITY OF WAIKATO • TE WHARE WAIKATO O WAIKATO

4 August 2008

23

## Networks

MAC addresses are wired in (flat)  
IP addresses are chosen (structured)

© THE UNIVERSITY OF WAIKATO • TE WHARE WAIKATO O WAIKATO

4 August 2008

24

## OSI

- Physical, Link: Ethernet
- Network: IPv4

## Summary

- Ethernet
  - Frames
  - MAC addresses
  - Network Interface Cards
  - Hubs, switches
- IP
  - Packets
  - IPv4 addresses
  - Routers
